Village Mayor/Clerk Village of Belmont 1 Schuyler Street Belmont, NY 14813

RE: Letter of Transmittal: Belmont Fire Department for the Village of Belmont

Dear Rick Hoshal,

We would like to inform you about the progress in designing the new fire hall building for the Village of Belmont. Following different rules and regulations we worked to produce various content which includes:

- References such as floodplain information and analysis of site and structure
- Contract Specifications
- Contract drawings

This structure is 25,059 SF which will support up to 7 full size fire trucks. Site design and building design (Structural, Architectural, and foundation) have been completed for the entire property of interest.

Lastly, the project must be presented to the Village of Belmont for approval. We will field any and all questions regarding project and scope of work and services. It was a pleasure in working with everybody in the Village of Belmont on this project and hope to follow up with everybody in a timely matter every step of the way.

Sincerely,

Steven Manicki Martin Koegst

Jose Romero Dakota Corrello

Project Planning

1.1 Introduction

The Village of Belmont is in need and looking to upgrade current Fire Facility so it meets their functionality needs and fulfills needs for the future of growing their fire department.

1.2 Location

The Village of Belmont's idea of location with respect to a new building was as simple as already owning a large piece of land that was shovel ready. The acreage of this property was 11.8 acres with a creek on the East side of the property and railroad tracks not too far from the location. The location is right outside of the Village of Belmont and in the Town of Amity. Figure 1 displays the approximate property line per New York State GIS Clearing house website and Alleghany tax maps. Figure 2 provides a street map view, Figure 3 provides floodplain information, and Figure 4 is a wetlands mapper.

Figure 1:

Figure 2 (Street Map view):

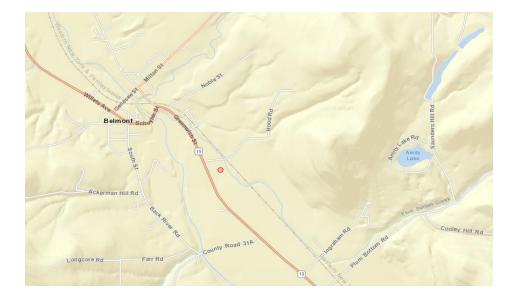

Figure 3 (Floodplains):

Figure 4 (Wetlands):

1.3 Population Trends

The project is for the Village of Belmont within the Town of Amity in Allegany County. As of the 2010 U.S. Census, the Village has a population of 2,520. Approximately twenty-five percent fall under the age of twenty, fifty-nine percent fall in the range of twenty and sixty-four years, and sixteen percent are aged sixty-five or older. There is a total of 1,016 Households located in the Village of Belmont in which the median income is approximately \$46,339 per the 2017 American Community Survey. The proposed project would also be overseeing a total of 34,541 total housing units, with 32,925 being occupied housing units and 1,616 being vacant housing units, per the 2010 U.S. Census.

Source:

https://factfinder.census.gov/faces/nav/jsf/pages/index.xhtml

1.4 Community Engagement

The Belmont Volunteer Fire Department established a strong relationship with their community as they train and accept volunteers. Establishing this relationship is a huge step within the community. Most importantly it allows for a community engagement response team or at least presenting fire routines for the community. It is a critical component of citizen engagement for the dedicated fire department and volunteers to know that they are well versed in such emergencies. The new facility will be able to house and allow the fire department to host such events and teach the community about emergencies. This demonstrates to the community that a new facility is needed and supersedes their needs in the community.

Existing Facilities

2.1 Location Map

https://cris.parks.ny.gov/

2.2 History

The Village of Belmont was first a village in 1833 and was actually named Philipsburg in honor of Philip Church. The village was incorporated on February 1, 1853 as Philipsville, but everything east of the Genesee River was called Miltonville. In 1870 a referendum was held at a local hotel and 70 voters decided on the name Belmont which originated from the French "Beaumont" meaning "beautiful hills". The Fire Hall was constructed in the 1930's along with the development and construction of a county courthouse, sheriff departments, and social services.

http://www.belmontny.org/html/history.html

2.3 Condition of Existing Facilities

2.3.1 Building

Being established in 1942, the existing facility has been part of a growing community. Currently there are 5 service trucks being housed in a 100 ft x 60 ft existing volunteer fire department facility. The area in which the fire trucks are housed is constrained as it does only house the trucks but also house lockers. Upon doing the walkthrough, it was pointed out by the firefighters that the areas are too small as they have to nearly squeeze in between trucks and only have a 1" from either side of truck when entering. There was not a separate

room for communications as it was shared with the fire chief. There existing conference hall was also noticed that was too small to host safety meetings, training or even just events for the public. In regards to their equipment, all room areas are required to take more than they can handle as some of these areas are used as storage for equipment that should have their own room.

2.3.2 Site/Roadways

The major issue with the existing site location is that it is susceptible to flooding. The Genesee River is located in front of the property and has caused major issues. This area is also on a flood plain zone which the facility has had issues with in the past. The facility is not equipped to handle these circumstances as there are drainage problems around the facility. Water has managed to enter the facility and cannot be easily drained out. The existing parking lot was also noticed that there was not enough parking slots and no designated parking for public and for employees. This has also created issues for the employees as some cars are forced to maneuver and park around the existing small lot.

2.3.3 Utilities

Based on the initial information provided by the Fire Chief, it is understood that there are all major utilities provided for the needs of the existing facility. All major utilities include water service, sewer, gas and electric. As for the new location, either existing or new utilizes have been installed along Greenwich Street, which would be used to make all connections to provide service for the proposed facility.

2.4 Financial Status of Any Existing Facilities

2.4.1 Revenues

General Taxation, fundraisers, and events.

2.4.2 Expenditures

Building upkeep, general building maintenance, and full time employees. (2 full timers). No other major expenditures were recorded.

Purpose and Need for Project

3.1 Purpose of the Project

3.1.1 Project Goals

The goal of this project is to outline a plan where the Village of Belmont can function with a growing number of firefighters and first responders. The current facility is outdated and needs major updates as a lot of the current facility cannot fulfill their needs anymore. The village of Belmont is looking to upgrade by adding additional bays for new fire trucks and the possibility of combining fire departments with an additional township.

3.2 Need for the Project

Need for the project included an expansion of fire truck bays in order to incorporate a merger between municipalities. New rooms for better functionality within the building, firefighters complained with the lack of room to move around and outdated mechanical systems and just general dysfunction.

Alternatives Considered

4.1 Description

Photovoltaic Systems, commonly known as solar panels are becoming more common in the country as they are energy efficient and money saving. With that being said, the Engineers have added Solar Panels as an alternative for the proposed fire hall. These solar panels will be designed so it will be able to provide the required output energy to have the proposed fire hall running. A summary of the engineer's system types is provided below as well as cost estimates for installing and utilizing the solar panels for primary source of energy.

4.2 Design Criteria

Using the U.S Energy Information Administration, on an average consumption for site electricity, a fire hall consumes 11.8 kW per hour per square foot. This would be rounded to 12 kW per hour per square foot which would be the design factor. A conservative value to use for as a solar panels capacity is 10 watts per square feet or for every kW that is generated, they will need 100 square feet of solar panels. As noted, 12 kW is needed, therefore the building would need 1,200 square feet of solar panels to be fully functional. It would be at best interest to contact a qualified manufacturer to provide a fully detailed design for installation. For installation feasibility, it would be best to install the solar panels on parts of the flat roof, as it provides the most area to suffice the 1,200 sq. ft. requirement and allows for preservation of land.

4.3 Maps

See appendix A

4.4 Environmental Impacts

Solar Panels are widely known for allowing the consumers to have savings in regard to their electric bill. However, on a larger scale, the environment also gains positive outtake as solar panels provide solar energy that do not produce air pollution, water pollution or greenhouse gases. Because of the zero-emission factor, solar panels don't contribute to

climate changes or health issues. This also helps reduce the use of other energy sources that have larger effects on the environment and allow for more growth in nearby locations.

4.5 Land Requirements

Solar panels are likely located on land areas or on roofs. However, in this scenario, it would be best suited for the fire hall to have the solar panels located on the roof. This eliminates the need of having to use land required for space reservation that the solar panels would need. For the proposed Fire Hall, the amount of energy required would be 12 kW. As discussed in design criteria, this would require 1,200 square feet amount of space for the solar panels which is feasible with the amount of space provided by the roof. Solar panels would also require the site to be free from shading which is not an issue with the proposed area. Solar Panels are ideally oriented towards true south but isn't required as solar panels can produce up to 95 percent of their capacity with just 20 degrees of the sun's direction.

4.6 Cost Estimates

The alternative of solar panels would allow the fire department to be more energy efficient. There primary source of energy would be highly dependent on the sun which will vary on a day to day basis as clouds can cover up the sun. According to the U.S. Energy Information Administration, the average consumption of electricity is 11.8 kW per hour per sq. ft. A typical month would consist of 730 hours and an average price of \$0.10 for a kW per hour, which would be \$73 for 730 kWh of electricity. With the proposed building of 27,080 sq. ft., the price for electricity can be \$861.40 for 730 kWh of electricity. On average, a solar panel system of 10 kW can cost up to \$70,000 and would require a minimum of 1,200 sq. ft. for the panels, which is the proposed option for the solar panels. The option of installing the solar panels is much cheaper on a month to month basis, with the only major concern being the upfront price of\$70,000 for purchasing the solar panels.

4.7 Non-Monetary Factors

A major attribute, as stated earlier, is the impacts of positive environmental impacts. The proposed fire hall can be seen as a leader to the Village of Belmont, as it is introducing solar panels to the area. This also allows for growth in the nearby areas as it discourages emissions that harm the environment. Another positive outtake is the longevity of the solar panels. Most solar panels have a life time of 20 years and don't require much maintenance. Some manufacturer provides warranty or buyout options for new solar panels which is an option for the fire hall. A major flaw for the solar panels for the proposed location would be the maintenance and repairs that will cause an issue. The solar panels will be subjected to large amounts of snow loads and cold climates which can cause degradation. A way to work around this would be to install the solar panels in a façade which will raise the installation fee.

Proposed Project

5.1 Preliminary Project Design

5.1.1 Site

See C102 in full set of drawings

5.1.2 Utilities

See C102 in full set of drawings

5.1.3 Structurals

5.2 Project Schedule

5.2.1 Major Project Milestones

Milestone	Date
Bidding to GCs	4/26/2019 - 5/17/2019
Bid Due Date	5/17/2019
Award of Contract	5/20/2019
GC Mobilization	7/1/2019
Certificate of Occupancy	7/1/2020

5.2.2 Proposed Construction Timeline

Trade	Projected Start Date
Sitework	7/2/2019
Foundations	7/8/2019
Masonry	10/21/2019
MEPs	12/16/2019
Finishes	2/10/2020
Flooring/Specialties	5/14/2020

5.3 Permit Requirements

See Appendix D

5.4 Sustainability Considerations

5.4.1 Green Infrastructure

Green infrastructure will potentially include solar panels. For the proposed Fire Hall, the amount of energy required would be 12 kW. As discussed in design criteria, this would require 1,200 square feet amount of space for the solar panels which is feasible with the

amount of space provided by the roof. Solar panels would also require the site to be free from shading which is not an issue with the proposed area.

5.5 Total Project Cost Estimate

5.5.1 See Appendix G

5.6 Annual Operating Budget 5.6.1 Debt Repayments

Annual Operation and Maintenance					
Task	<u>Unit</u>	<u>Unit Cost</u>	Estimate/Year	To	tal
Insurance	annual	\$ 5,000.00	1.0	\$	5,000
Utilities Bill	monthly	\$ 1,000.00	12.0	\$	12,000
Sealcoat Asphalt	per visit	\$ 5,000.00	0.1	\$	500
HVAC System Repair	per visit	\$ 2,000.00	0.3	\$	666
Snow Plowing	per visit	\$ 150.00	20.0	\$	3,000
Debris Removal from Stormwater Pond	per visit	\$ 100.00	1.0	\$	100
Plumbing Fixture Repair	per visit	\$ 1,000.00	0.3	\$	333
Mow	per visit	\$ 150.00	10.0	\$	1,500
Total O&M Cost Per Year				\$	23,099

6.0 Conclusion

The completion of the 25,000 SF proposed fire hall will be housing more than 7 full sized fire trucks, as it will be able to supply the needs of the volunteer fire fighters. This project will also include the needs for visitors as it will have more than 200 parking spaces, and private entrance. The current standing of the facility does not supply these needs as the main entrance for fire trucks and visitors are congested into one entrance/exit. As well as the overall integrity of the facility, due to the space constraints and previous flooding issues, suggest the need of an upgraded facility at the new location.

As discussed in the earlier sections, the new facility will be more than capable of providing the necessary needs for the Village of Belmont, Town of Amity and Town of Ward. The facility will not only house 7 full sized trucks, but will provide equipped rooms such as chief's office, communication, conference room, etc. There will be more than enough parking spaces for public utilization with its own entrance and exit along Hood Rood. The main entrance/exit for the fire trucks will be along State Road 19, which is intended to be used only by fire trucks. Due to having utilities along State Road 19, this would allow for feasibility and tapping into existing lines such as water, sewer and gas, through excavation means to allow the facility to be powered. The proposed location is exposed to flooding, which would require the land to be filled and raised.

Overall, there is more than enough room to provide means of growth or addition to the facility by the owner. It may be recommended that the owner take into consideration some of the alternatives provided as they will be able to be used for practical purposes and benefit the areas of service. The addition of solar panels will allow the client to save money on electricity and can lead the way to a green sustainable community. Having a backup generator will help the facility with any power outages or serve the public as an emergency shelter. The addition of a new training facility will allow for spacious training within the facility.

Totals for Area of Inter	rest		11.0	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Provide the Geographic Coordinates for the project site in NYTM Units. To do this you
must go to the NYSDEC Stormwater Interactive Map on the DEC website at:

www.dec.ny.gov/imsmaps/stormwater/viewer.htm

Zoom into your Project Location such that you can accurately click on the centroid of your site. Once you have located your project site, go to the tool boxes on the top and choose "i"(identify). Then click on the center of your site and a new window containing the X, Y coordinates in UTM will pop up. Transcribe these coordinates into the boxes below. For problems with the interactive map use the help function.

15. Does the site runoff enter a separate storm sever system (including roadside drains, swales, ditches, culverts, etc.)?

16. What is the name of the municipality/entity that owns the separate storm sewer system?

VI	LLAGE OF BELMONT	
17.	Does any runoff from the site enter a sewer classified	
18.	as a Combined Sewer? O Yes O Will future use of this site be an agricultural property as defined by the NYS Agriculture and Markets Law?	ONo ●Unknown OYes ●No
19.	Is this property owned by a state authority, state agency, federal government or local government?	🗑 Yes 🛛 No
20.	Is this a remediation project being done under a Department approved work plan? (j.e. CERCLA, RCRA, Voluntary Cleanup Agreement, etc.)	OYes 🌒 No
21.	Has the required Erosion and Sediment Control component of the SWPPP been developed in conformance with the current NYS Standards and Specifications for Erosion and Sediment Control (aka Blue Book)?	●Yes ○No
22.	Does this construction activity require the development of a SWPPP that includes the post-construction stormwater management practice component (i.e. Runoff Reduction, Water Quality and Quantity Control practices/techniques)? If No, skip questions 23 and 27-39.	●Yes ○No
23.	Has the post-construction stormwater management practice component of the SWPPP been developed in conformance with the current NYS Stormwater Management Design Manual?	t •Yes ONo

SWPPP Preparer Certification

I hereby certify that the <u>Stormwater</u> Pollution Prevention Plan (SWPPP) for this project has been prepared in accordance with the terms and conditions of the GP-0-15-002. Furthermore, I understand that certifying false, incorrect or inaccurate information is a violation of this permit and the laws of the State of New York and could subject me to criminal, civil and/or administrative proceedings.

 Select all of the erosion and sediment control practices that will be employed on the project site:

Temporary Structural

- O Check Dams
- Construction Road Stabilization
- O Dust Control
- O Earth Dike
- O Level Spreader
- O Perimeter Dike/Swale
- O Pipe Slope Drain
- O Portable Sediment Tank
- O Rock Dam
- O Sediment Basin
- Sediment Traps
- Silt Fence
- Stabilized Construction Entrance
- Storm Drain Inlet Protection
- O Straw/Hay Bale Dike
- O Temporary Access Waterway Crossing
- O Temporary Stormdrain Diversion
- O Temporary Swale
- O Turbidity Curtain
- O Water bars

Biotechnical

- O Brush Matting
- O Wattling

Other

Vegetative Measures

- O Brush Matting
- O Dune Stabilization
- O Grassed Waterway
- O Mulching
- Protecting Vegetation
- O Recreation Area Improvement
- Seeding
- Sodding
- O Straw/Hay Bale Dike
- O Streambank Protection
- O Temporary Swale
- O Topsoiling
- O Vegetating Waterways
 - Permanent Structural
- Debris Basin
- O Diversion
- Grade Stabilization Structure
- Land Grading
- O Lined Waterway (Rock)
- O Paved Channel (Concrete)
- O Paved Flume
- Retaining Wall
- Riprap Slope Protection
- O Rock Outlet Protection
- O Streambank Protection

0182089828

Post-construction Stormwater Management Practice (SMP) Requirements

Important: Completion of Questions 27-39 is not required if response to Question 22 is No.

27. Identify all site planning practices that were used to prepare the final site plan/layout for the project.
O Preservation of Undisturbed Areas
O Preservation of Euffers
Reduction of Clearing and Grading
O Locating Development in Less Sensitive Areas
O Roadway Reduction
O Sidewalk Reduction
O Driveway Reduction
O Cul-de-sac Reduction
O Building Footprint Reduction

O Parking Reduction

- 27a. Indicate which of the following soil restoration criteria was used to address the requirements in Section 5.1.6("Soil Restoration") of the Design Manual (2010 version).
 - O All disturbed areas will be restored in accordance with the Soil Restoration requirements in Table 5.3 of the Design Manual (see page 5-22).
 - Compacted areas were considered as impervious cover when calculating the MCX Required, and the compacted areas were assigned a post-construction Hydrologic Soil Group (HSG) designation that is one level less permeable than existing conditions for the hydrology analysis.
- Provide the total Water Quality Volume (WQX) required for this project (based on final site plan/layout).

Total WOX Required

29. Identify the RR techniques (Area Reduction), RR techniques (Volume Reduction) and Standard SMPs with RRy Capacity in Table 1 (See Page 9) that were used to reduce the Total WQy Required (#28).

Also, provide in Table 1 the total impervious area that contributes runoff to each technique/practice selected. For the Area Reduction Techniques, provide the total contributing area (includes pervious area) and, if applicable, the total impervious area that contributes runoff to the technique/practice.

<u>Note:</u> Redevelopment projects shall use Tables 1 and 2 to identify the SMPs used to treat and/or reduce the WQX required. If runoff reduction techniques will not be used to reduce the required WQX, skip to question 33a after identifying the SMPs.

III. Reason for Termination	
9a.x All disturbed areas have achieved final stabilization in accord SWPPP. *Date final stabilization completed (month/year): 0-	
9b. x Permit coverage has been transferred to new owner/operate	or. Indicate new owner/operator's permit
identification number: NYR (Note: Permit coverage can not be terminated by owner id owner/operator obtains coverage under the general permit)	dentified in I.1. above until new
9c. □ Other (Explain on Page 2)	
IV. Final Site Information:	
10a. Did this construction activity require the development of a stormwater management practices? x yes $\Box$ no (If no, go	SWPPP that includes post-construction to question 10f.)

10b. Have all post-construction stormwater management practices included in the final SWPPP been constructed? x yes  $\Box$  no (If no, explain on Page 2)

10c. Identify the entity responsible for long-term operation and maintenance of practice(s)?

The owner's maintenance team will be responsible for long-term operation and maintenance of practices.

### **NOTICE OF TERMINATION** for Storm Water Discharges Authorized under the SPDES General Permit for Construction Activity - continued

10d. Has the entity responsible for long-term operation and maintenance been given a copy of the operation and maintenance plan required by the general permit?  $\Box$  yes x no

10e. Indicate the method used to ensure long-term operation and maintenance of the post-construction stormwater management practice(s):

□ Post-construction stormwater management practice(s) and any right-of-way(s) needed to maintain practice(s) have been deeded to the municipality.

x Executed maintenance agreement is in place with the municipality that will maintain the postconstruction stormwater management practice(s).

□ For post-construction stormwater management practices that are privately owned, a mechanism is in place that requires operation and maintenance of the practice(s) in accordance with the operation and maintenance plan, such as a deed covenant in the owner or operator's deed of record.

□ For post-construction stormwater management practices that are owned by a public or private institution (e.g. school, university or hospital), government agency or authority, or public utility; policy and procedures are in place that ensures operation and maintenance of the practice(s) in accordance with the operation and maintenance plan.

10f. Provide the total area of impervious surface (i.e. roof, pavement, concrete, gravel, etc.) constructed within the disturbance area?

(acres) 0.235

11. Is this project subject to the requirements of a regulated, traditional land use control MS4?  $\Box$  yes x no

(If Yes, complete section VI - "MS4 Acceptance" statement

V. Additional Information/Explanation: (Use this section to answer questions 9c. and 10b., if applicable)

# **NOTICE OF TERMINATION** for Storm Water Discharges Authorized under the SPDES General Permit for Construction Activity - continued

VII. Qualified Inspector Certification - Final Stabilization:

I hereby certify that all disturbed areas have achieved final stabilization as defined in the current version of the general permit, and that all temporary, structural erosion and sediment control measures have been removed. Furthermore, I understand that certifying false, incorrect or inaccurate information is a violation of the referenced permit and the laws of the State of New York and could subject me to criminal, civil and/or administrative proceedings.

Printed Name: Steven Manicki

Title/Position: SWPPP Inspector

Signature: Steven Manicki

Date: 04/09/2020

### VIII. Qualified Inspector Certification - Post-construction Stormwater Management Practice(s):

I hereby certify that all post-construction stormwater management practices have been constructed in conformance with the SWPPP. Furthermore, I understand that certifying false, incorrect or inaccurate information is a violation of the referenced permit and the laws of the State of New York and could subject me to criminal, civil and/or administrative proceedings.

Printed Name: Steven Manicki

Title/Position: SWPPP Inspector

(NYS DEC Notice of Termination - January 2015)

# **APPENDIX C**

# American with Disabilities Act (ADA) of 1990 Assignment

STEVEN MANICKI, MARTIN KOEGST, JOSE ROMERO, & DAKOTA CORRELLO

Cash register counter (Golisano Hall) maximum height to be ADA complaint is 36".

Per ADA Code 7.2, there must be a portion of the main encounter that is no more than 36 inches high. If this weren't the case, then there must a lower auxiliary counter or folding shelf provided.

Lights in ENT turn on automatically (motion sensor) in front entranceway.

Per ADA Code 10.3, fixed facilities must be usable by persons with vision impairment. Facilities with mechanical or motion sensors are more likely to help those who are impaired.

Door lever is parallel to floor and opens with little downward pressure.

Per ADA Code 4.13, doors must be opened without too much force. If this weren't the case, then lighter doors or automatic door openers must be installed.

Automatic door opener button in front entrance of Golisano Hall. Height is 36".

Per ADA Code 4.13, a person using a wheelchair or crutches needs to be able to open doors without assistance. For their assistance, automatic door openers must be provided.

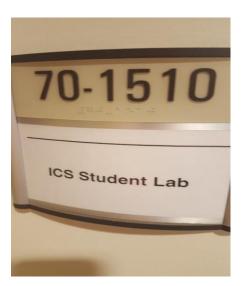

Elevator call button is 43".

Per ADA Code 4.27, all controls must be available for use by the public such that is it a maximum range reach of 54 inches.

Elevator buttons are low enough to accommodate a person in a wheelchair. (36")

Per ADA Code 4.10, all call buttons are no higher than 42 inches. If this weren't the case, then the buttons must be lowered.

Door signs in Golisano Hall equipped with braille lettering for the sight-impaired.

Per ADA Code 4.30, raised and brailed characters shall be provided to aid impaired public.

Tables located in Golisano Hall provide 22" depth for a wheelchair to fit comfortably underneath.

Per ADA Code 4.2, knee spaces at accessible tables are at least 19 inches deep. If this weren't the case, then the tables must be replaced with other tables that comply with the codes.

Drinking fountain in Golisano Hall height is 36" and provides enough space for wheelchair to fit underneath.

Per ADA Code 4.15, drinking fountains must be located with clear floor space at no higher than 36 inches from the ground. If drinking fountains don't comply with the code, then cup dispensers must be provided.

Grab bar in ENT located on left side of toilet to provide stability for a person in a wheelchair.

Per ADA Code 4.17, accessible stalls must be provided with grab bars behind and on the side wall of the nearest to the toilet.

Fire Hall Design

Handicapped parking space located in front of ENT hall. Striped area on the left of the space provides enough room for a wheelchair to maneuver.

Per ADA Code 4.8, parking and drop-off areas are the spaces closest to the accessible entrance.

Per ADA Code 4.9, stairs have continuous rails on both sides, with continuous rails on both sides, with extensions beyond the top and bottom stairs.

Staircase equipped with railing on both sides to provide people with more stability walking up stairs.

Emergency call button in ENT front entrance located 36" above floor to provide ease of use to people in wheelchair.

Per ADA Code 4.27, all controls that are available for use by the public, should be located at an accessible height. These self-service controls must be within 54 inches of reach.

Women's room entrance door located 18" away from wall to provide room for people in wheelchair to comfortably open door.

Per ADA Code 4.13, there must be at least 18 inches of clear wall space on the pull side of the door to allow room for a person using a wheelchair or crutches. If not, then remove or relocate furnishings, or move door to allow for room.

Payphone located in Golisano Hall place 36" above floor to provide ease of access to people in wheelchair.

Per ADA Code 4.31, public phones must be no higher than 48 inches. If it does not meet this requirement, then the phone must be lowered.

ADA complaint push door handle to provide ease for people in wheelchairs to exit building.

Per ADA Code 4.13, doors must be opened without too much force. It would be best to install power-assisted, door bars or automatic door openers.

Stairs in front entrance of ENT with non-slip treads to provide stable surface to walk up and down.

Per ADA Code 4.9, the treads must have a non-slip surface. If there are none presented, then they must be added to the treads.

Hallway in Golisano Hall is 8' wide, (Minimum 36") to accommodate wheelchair use.

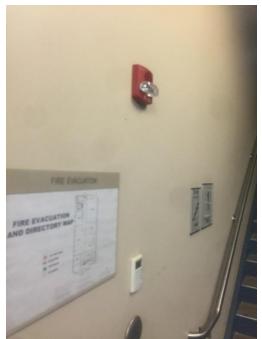

Per ADA Code 4.3, thee route must be at least 36 inches wide to accommodate wheelchair use. If they are not, then the area must be modified or furnishing moved to allow route of travel.

Curb reveal next to ENT building and Institute Hall. Flush to crosswalk to provide access to wheelchairs.

Per ADA Code 4.6, the access aisles must be part of the accessible route. If not then curbs, curb ramps must be added, or the sidewalk must be reconstructed.

Fire Alarm in ENT building equipped with flashing light to warn the haring-impaired.

Per ADA Code 4.28, emergency systems provided must have both flashing lights and audible signals. If they are not present, then they must be added to the facility.

ADA Items related to the Belmont Fire Hall Project:

- Handicap parking spaces
- Curb reveal
- Fire alarms with light warning
- 36" hallway
- Grab bars and other ADA complaint toilet accessories
- Handicap buttons for entrance doors
- Tables that provide enough height/depth to accommodate wheelchair use
- Drinking fountains the provide enough height and depth to accommodate wheelchair use
- ADA complaint door handles

## APPENDIX D

### March 6, 2019

Village Mayor Village Board Members Village of Belmont 1 Schuyler St Belmont, NY 14813

### **RE:** Village of Belmont Fire Hall Project

SEQR

Dear Rich:

We have completed the State Environmental Quality Review (SEQR) for the construction of the Belmont Fire Hall Project. We have determined that this action has a SEQR Status of **Type I Action** due to the project physically altering more than 10 acres, section 617.4 (b)(6). This action requires a coordinated review.

Enclosed, please find one copy of the following:

- The SEQR Short Environmental Assessment Form for the Belmont Fire Hall Project.
- The SEQR Part 2 & 3 Form.
- A suggested resolution for accepting the SEQR determination and Negative Declaration for the Belmont Fire Hall Project.

Please review the completed documents and sign as indicated. We recommend that the Town Board act on the proposed Resolution.

Please call with questions.

Sincerely,

Steven Manicki

Martin Koegst

Jose Romero

Dakota Corrello

### SEQR RESOLUTION RESOLUTION DETERMINING THAT PROPOSED ACTION IS A TYPE I ACTION FOR PURPOSES OF THE NEW YORK STATE ENVIRONMENTAL QUALITY REVIEW ACT

By Trustee _____ March 6, 2019

WHEREAS, the Town desires to comply with New York State Environmental Quality Review Act ("SEQR") and the regulations adopted by the Department of Environmental Conservation of the State of New York, being 6 NYSCRR Part 617, with respect to the Project, **Belmont Fire Hall**; and

WHEREAS, the Project is subject to review under SEQR since it involves an action that involves a physical alteration of more than 10 acres, which is listed as a "Type I Action" under Section 617.7 NYSCRR. This Type I Action requires a coordinated review.

RESOLVED that the Village Board concurs with the SEQR resolution prepared by DMSJ Engineers and Architects, which states the Belmont Fire Hall project will not negatively impact the environment.

FURTHER RESOLVED that the Board of the Village of Belmont agrees with DMSJ Engineers and Architects, and accepts the Environmental Assessment of this Project prepared by DMSJ.

BE IT FURTHER RESOLVED, that this resolution shall take effect immediately. Seconded by Trustee ______.

Upon being put to a vote, the resolution was _____

### Short Environmental Assessment Form Part 1 - Project Information

### Instructions for Completing

Part 1 – Project Information. The applicant or project sponsor is responsible for the completion of Part 1. Responses become part of the application for approval or funding, are subject to public review, and may be subject to further verification. Complete Part 1 based on information currently available. If additional research or investigation would be needed to fully respond to any item, please answer as thoroughly as possible based on current information.

Complete all items in Part 1. You may also provide any additional information which you believe will be needed by or useful to the lead agency; attach additional pages as necessary to supplement any item.

Part 1 – Project and Sponsor Information					14
Belmont Fire Hall/Town of Belmont

Part 1 / Question 7 [Critical Environmental Area]	No
Part 1 / Question 12a [National or State Register of Historic Places or State Eligible Sites]	No
Part 1 / Question 12b [Archeological Sites]	Yes
Part 1 / Question 13a [Wetlands or Other Regulated Waterbodies]	Yes - Digital mapping information on local and federal wetlands and waterbodies is known to be incomplete. Refer to EAF Workbook.
Part 1 / Question 15 [Threatened or Endangered Animal]	No
Part 1 / Question 16 [100 Year Flood Plain]	Digital mapping data are not available or are incomplete. Refer to EAF Workbook.
Part 1 / Question 20 [Remediation Site]	No

Short Environmental Assessment Form - EAF Mapper Summary Report

Agency Use Only [If applicable] Project: Belmont Fire Hall Date: 03/06/2019

### Short Environmental Assessment Form Part 2 - Impact Assessment

### Part 2 is to be completed by the Lead Agency.

Answer all of the following questions in Part 2 using the information contained in Part 1 and other materials submitted by the project sponsor or otherwise available to the reviewer. When answering the questions the reviewer should be guided by the concept "Have my responses been reasonable considering the scale and context of the proposed action?"

		No, or small impact may occur	Moderate to large impact may occur
1.	Will the proposed action create a material conflict with an adopted land use plan or zoning regulations?		1
2.	Will the proposed action result in a change in the use or intensity of use of land?		$\checkmark$
3.	Will the proposed action impair the character or quality of the existing community?	1	
4.	Will the proposed action have an impact on the environmental characteristics that caused the establishment of a Critical Environmental Area (CEA)?	1	
5.	Will the proposed action result in an adverse change in the existing level of traffic or affect existing infrastructure for mass transit, biking or walkway?	$\checkmark$	
б.	Will the proposed action cause an increase in the use of energy and it fails to incorporate reasonably available energy conservation or renewable energy opportunities?	1	
7.	Will the proposed action impact existing: a. public / private water supplies?	$\checkmark$	
	b. public / private wastewater treatment utilities?	$\checkmark$	
8.	Will the proposed action impair the character or quality of important historic, archaeological, architectural or aesthetic resources?	$\checkmark$	
9.	Will the proposed action result in an adverse change to natural resources (e.g., wetlands, waterbodies, groundwater, air quality, flora and fauna)?	1	
10.	Will the proposed action result in an increase in the potential for erosion, flooding or drainage problems?	$\checkmark$	
11.	Will the proposed action create a hazard to environmental resources or human health?	1

Agency Use Only [If applicable] Project: Belmont Fire Hall Date: 03/06/2019

### Short Environmental Assessment Form Part 3 Determination of Significance

For every question in Part 2 that was answered "moderate to large impact may occur", or if there is a need to explain why a particular element of the proposed action may or will not result in a significant adverse environmental impact, please complete Part 3. Part 3 should, in sufficient detail, identify the impact, including any measures or design elements that have been included by the project sponsor to avoid or reduce impacts. Part 3 should also explain how the lead agency determined that the impact may or will not be significant. Each potential impact should be assessed considering its setting, probability of occurring, duration, irreversibility, geographic scope and magnitude. Also consider the potential for short-term, long-term and cumulative impacts.

Question 1: Proposed site is currently zoned for agricultural use. New use will be zoned as heavy industry (public safety use).

Question 2: Proposed site will no longer be used for agricultural purposes. Land will be used for public safety use. The existing water and sewer infrastructure can handle the additional load.

Check this box if you have determined, based on the info that the proposed action may result in one or more pot environmental impact statement is required.	ermation and analysis above, and any supporting documentation, entially large or significant adverse impacts and an

# **Excavating**

# Section 315000

# Done by: Steven Manicki

# PART 1 GENERAL

- 1.1 SECTION INCLUDES:
  - A. Excavation for building foundations and down to pile caps.
  - B. Excavation for slabs on grade, paving and landscaping.
  - C. Excavation for site strucutres
- 1.2 RELATED SECTIONS
  - A. Inspection of bearing surfaces
  - B. Barriers, water controls, erosion and sediment control
  - C. Protection of existing facilities
  - D. Site clearing strip 6" of topsoil, then excavate
  - E. Backfill with 2" crusher run where utilities are being installed.
  - F. Trenching, excavation for underground utilities
  - G. General rock removal, use a quality rock hound. Set landscape up to grow quality vegetation.
- 1.3 FIELD MEASUREMENTS
  - A. Verify that survey benchmark and intended elevations for the work are as indicated.

# PART 2 EXECUTION

- 2.1 Preparation
  - A. Identify required lines, levels, contours, and datum. Review geotechnical report and other available site information pertaining to site of interest.
  - B. Identify known underground, above ground, and other utilities. Stake and flag locations.
  - C. Notify utility company to remove and relocate utilities as needed at Contractor's expense.
  - D. Protect above and below grade utilities which will remain.
  - E. Protect current vegetation with burlap and other vegetation protection.
  - F. Protect benchmarks, existing structures, fences, sidewalks, paving, and curbs from excavation equipment and other traffic.
  - G. Excavations shall be in complete accordance with all details of applicable codes, rules, and regulations including all local, state, and federal regulations including OSHA.

# 2.2 CLASSIFICATION OF EXCAVATED MATERIAL

A. Classifications of excavated materials are as follows:

1. Unclassified excavation – includes all material excavated within the authorized lines and grades prescribed in the Drawings.

2. Common Excavation - "Common excavation" shall include all excavation except "rock excavation." All unconsolidated material, rippable rock, loose rock, soft mineral matter, weathered rock, and soft or friable shale which is removable with normal earth excavation equipment shall be considered "common excavation." All boulders and detached pieces of solid rock or concrete or masonry less than 1 cubic yard in volume shall be classified as "common excavation."

3. Rock Excavation - "Rock excavation" shall include all sound solid masses, layers and ledges of consolidated rock or mineral matter of such hardness, durability and/or texture that it is not rippable or cannot be excavated with normal earth excavation equipment.

3.1 When rock is encountered in excavations, it shall be removed by blasting methods, jackhammering or any other method suitable and safe considering the proximity of existing utilities or facilities.

3.2 Blasting operations shall conform to the requirements of National Fire Protection Association (NFPA) 495 - Code for Explosive Materials, and by applicable state or local regulations.

# 2.3 EXCAVATING

A. Underpin adjacent structures which may be damaged by excavation work, including utilities and pipe chases.

B. Excavate subsoil required to accommodate building foundations, slabs-on-grade paving site structures, and construction operations.

C. Excavate to working elevations for piling work and coordinate special requirements for piling.

D. Grade top perimeter of excavation to prevent surface water from draining into excavation.

E. Hand trim excavation to required undisturbed subgrade. Remove loose matter.

F. Remove lumped subsoil, boulders, and rock under 1 cubic yard, measured by volume. Refill voids with Mix "C" concrete or compacted gravel/crushed stone.

G. Notify Engineer of unexpected subsurface conditions, or of questionable soils encountered at required subgrade elevations, and discontinue work in area until notified to resume operations.

H. Should the Contractor, through negligence or otherwise carry his excavation below the designated subgrade, Mix "C" concrete or such other materials as may be approved by the Engineer, shall be furnished and placed as backfill in sufficient quantities to reestablish the designated subgrade surface.

I. All excavated materials must remain on site. Stockpile excavated material in area designated on-site and remove excess material not being reused, from site. Remove excavated material from site.

# 2.4. DISPOSAL OF MATERIAL

A. All excavated material except reusable topsoil or reusable fill shall be classified as surplus material and disposed of off-site unless Owner designates an on-site location.

B. On-site disposal of surplus material will be allowed only at locations designated by Owner and approved by Engineer.

C. Make all arrangements for disposal sites, unless the Owner designates special locations. All expenses for disposal shall be borne by the Contractor. Bidders shall carefully investigate all aspects of surplus material disposing operations.

D. Prior to depositing surplus material at any off-site location, obtain a written agreement between Contractor and the owner of the property on which the disposal of the material is proposed. The agreement shall state that the owner of the property gives permission for the Contractor to enter and deposit material of a particular classification on the owner's property at no expense to the project Owner, and shall include any other conditions pertinent to the situation as agreed upon by each party. A copy of said agreement shall be furnished to the Owner.

# 2.5. FIELD QUALITY CONTROL

A. Field inspection will be performed by Owner's representative and Engineer's representative.

B. Provide for visual inspection of bearing surfaces.

# 2.6. PROTECTION

A. Protect excavations by methods required to prevent cave-in or loose soil from falling into excavation.

B. Protect bottom of excavations and soil adjacent to and beneath foundation, from freezing.

C. Exposed subgrade surfaces shall remain undisturbed, drained, and maintained as uniform, plane areas, shaped to receive the foundation components of the building or structure.

END OF SECTION

# SECTION 079200 JOINT SEALANTS Done by: Jose Romero

# PART 1 - GENERAL

# 1.01 SECTION INCLUDES

- A. Silicone joint sealants
- B. Latex joint sealants
- C. Solvent-release-curing joint sealants

# Part 2 – PRODUCTS

# 2.01 SILICONE JOINT SEALANTS

- A. Single-Component, Neutral-Curing Silicone Joint Sealant
- 1. Products subject to compliance with requirements and applicable standards for their materials.
- 2.02 LATEX JOINT SEALANTS
  - A. Acrylic latex and/or siliconized acrylic latex
  - 1. Products subject to compliance with requirements and applicable standards for their materials.

# 2.03 SOLVENT-RELEASE-CURING JOINT SEALANTS

- A. Butyl-Rubber-Based Joint Sealant.
  - 1. Products subject to compliance with requirements and applicable standards for their materials.
  - Part 3 Execution
  - 3.01 EXAMINATION
    - A. Verify that joints are ready to receive work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

# **3.02 PREPARATION**

- A. Clean out joints immediately prior to installing joint sealants.
- B. Apply primer to the joints to comply with joint sealant manufacturer's written instructions.
- C. Use masking tape where required to prevent contact of sealant with the adjoining surfaces that would be permanently stained or damaged.

# 3.03 INSTALLATION

- A. All joint sealants to comply with joint sealant manufacturer's written instructions
- B. Measure joint dimensions and size joint backers to achieve desired width-to-depth ratio, neck dimension as recommended by manufacturer.
- C. Install bond-breaker tape behind sealants where sealants backing is not used between sealants and back of joints.
- D. Install bond breaker backing tape where backer rod cannot be used.

E. Install sealant free of air pockets, foreign embedded matter, ridges, sags and without getting sealant on adjacent surfaces.

F. Remove tape immediately after tooling without disturbing joint sealant.

Part 4 – MEASUREMENT AND PAYMENT

4.01 ALL CONTRACTS

Not used.

# Concrete Unit Masonry 042200 Done By: Dakota Corrello

PART 1 GENERAL

1.01 SUMMARY

A. Provide materials, labor, and equipment necessary for the completion of concrete masonry work as indicated on the drawings and specified here.

# **1.02 REFERENCES**

A. ASTM C-90 – Standard Specification for Loadbearing Concrete Masonry Units. 1.03 CODES AND STANDARDS

A. Perform work with materials complying with ASTM and ACI specifications. 1.04 INSPECTION

A. Conform to the requirements of Section 01401 – Testing and Inspections. 1.05 SUBMITTALS

A. Submittal procedures and quantities are specified in Section 01300 – Submittal.

B. Submit copies of manufacture's product information and installation instructions for each item and accessory.

C. Submit samples of exposed masonry units, indicating special shapes, textures, and colors.

# **1.06 QUALITY ASSURANCE**

A. Before installation of concrete masonry, a sample panel must be assembled by the mason, then approved by the architect.

B. The panel shall be at least 4 feet long by 4 feet high and shall show the proposed color, texture, bond, pattern, mortar joints, and workmanship for concrete masonry. The panel shall be cleaned according to Section 3.05 Final Clean Down; the same methods and materials used to clean the sample panel shall be used to clean the building.

C. upon approval by the architect, the sample panels shall become the standard of comparison for concrete masonry construction on the project and shall not be taken down without written permission from the architect.

# PART 2 PRODUCTS

# 2.01 CONCRETE UNIT MASONRY

A. Load bearing concrete masonry units shall comply with ASTM C90 (latest edition) and provide required shapes such as double ends, bullnose, bond beams, lintels, sills, etc. as required by the project.

B. Provide the following type of concrete masonry units as indicated on the drawings: Regular 10" standard blocks.

2.02 MORTAR AND GROUT MIXES

A. For color consistency and quality consistency, premixed mortar is required

B. When using concrete masonry units that contain integral water repellent, the installer shall use only mortar containing integral water repellent mortar admixture at the manufacturer's recommended addition rate and mix according to the manufacturer's recommended instructions.

## PART 3 EXECUTION

## **3.1 GENERAL ERECTION REQUIREMENTS**

A. Install units level, aligned, plumb, and true unless otherwise indicated. Install only quality units; reject all defective units.

B. In order to assure optimum blending of product when using blended color units of any type, stage cubes so that two or more cubes can be worked off of at the same time. Mason is to lay wall off at least two cubes of blended color product at the same time for even distribution of color. Avoid constructing wall that have a "spotty" visual effect.

C. Neatly cut units utilizing a power masonry saw to obtain crisp, sharp edges that fit neatly with all adjoining work.

D. Place adequate lighting a reasonable distance from the masonry work to ensure even illumination of the area. Do not use trough lighting.

E. Lay units with full mortar coverage on head and bed joints, taking care not to obstruct or file cores to be grouted or insulated. Keep cavity areas free of debris.

F. Tuck-point the joints of rake scored units and tool with a concave profile finish to match surrounding units.

G. Tool all mortar joints when thumb print hard. Remove all excess mortar from the face of masonry units before it sets.

H. Cover and keep dry all materials stored at the jobsite. At the end of work each day, cover the top of the wall in such a way that rain or snow will not get into the cores or wall cavity.

3.2 CONTROL JOINTS AND HORIZONTAL JOINT REINFORCEMENT

A. Do not continue Bond Beam Reinforcement or Horizontal Joint Reinforcement across control joints unless otherwise shown on plans as indicated by the Structural Engineer.

B. Install preformed joint filler material at locations indicated on drawings. Space control joints as shown on drawings; spacing however should not exceed 1 ½ times the height of the building or 25 feet (whichever is less) for structural walls or 1 ½ times the height or 20 feet (whichever is less) for veneer walls.

C. Install horizontal joint reinforcement at 16" vertical spacing except space at 8" below finished floors and in parapet walls and where otherwise indicated on drawings. Horizontal Joint Reinforcement should always be overlapped a minimum of 6 inches and should be used on all depths of Concrete Masonry including Veneer Depth units. Do not extend horizontal reinforcement through control joints unless dictated by the Structural Engineer. 3.3 FLASHING AND WEEP HOLES

A. Install flashing and end dams at all locations shown in the plans. Keep flashing free or mortar debris. Install flashing in strict accordance with the details shown.

B. Install weep holes 32" O.C. at courses above grade, above flashing, and at waterstops over doors, windows, and beam areas.

C. If weep holes are used, only 100% cotton rope is to be used in weep holes; synthetic materials are specifically prohibited.

# **3.4 DAILY CLEANING**

A. Clean completed worj daily using brushes, clean rags, and/or burlap. Do not allow excess mortar to dry and harden on the face of the wall.

# **3.5 FINAL CLEAN DOWN**

A. Job site mixed muriatic acid is specifically prohibited; use Eaco Chem NMD 80 in strict accordance with the manufacture's recommendations. Thoroughly pre-wet the area to be cleaned. Allow product to work and thoroughly rinse with clean, potable water when complete. All work is to be done in accordance with manufacture's recommendations. Job site sample panel must first be cleaned (using the same methods that will be used on the rest of the project) and approved by the architect before proceeding with the cleaning of the building. Job site sample panel will not be discarded or destroyed unless specifically approved (in writing) by the architect.

# **3.6 INSPECTION**

A. The face of the finished wall shall be free of chips, cracks, or other imperfections that would detract from the overall appearance of the wall when viewed from a right angle at a distance of 20 feet under normal diffused lighting.

### **SECTION 03 3001**

## CONCRETE SIDEWALKS, CURBS AND EXTERIOR CONCRETE FLATWORK

Done by: Martin Koegst

## PART 1 GENERAL

### 1.01 SUMMARY

- A. This Section includes exterior Portland cement concrete paving for the following:
- 1. Curbs.

2. Walkways.

## **1.02 SUBMITTALS**

A. General: Submit the following, according to the Conditions of the Contract.

- 1. Product data for proprietary materials and items, including reinforcement and forming accessories, admixtures, joint systems, curing compounds, dry-shake finish materials, and others if requested by Architect.
- 2. Design mixes for each class of concrete. Include revised mix proportions when characteristics of materials, project conditions, weather, test results, or other circumstances warrant adjustments.
  - 3. Laboratory test reports for evaluation of concrete materials and mix design tests.

## **1.03 QUALITY ASSURANCE**

A. Concrete Standards: Comply with provisions of the following standards,

- 1. American Concrete Institute (ACI) 301, "Specification for Structural Concrete for Buildings."
- 2. ACI 318-14, "Building Code Requirements for Structural Concrete".
- 3. Concrete Reinforcing Steel Institute (CRSI) "Manual of Standard Practice".

B. Concrete Manufacturer Qualifications: Manufacturer of ready-mixed concrete products complying with ASTM C94 requirements.

### **1.04 PROJECT CONDITIONS**

A. Traffic Control: Maintain access for vehicular and pedestrian traffic as required for other construction activities.

### PART 2 PRODUCTS

### 2.01 FORMS

A. Form Materials: Plywood, metal, metal-framed plywood, or other acceptable panel-type materials to provide full-depth, continuous, straight, smooth exposed surfaces.

### 2.02 REINFORCING MATERIALS

A. Reinforcing Bars and Tie Bars: ASTM A 615, Grade 60, deformed.

B. Deformed-Steel Welded Wire Fabric: ASTM A 497.

C. Supports for Reinforcement: Chairs, spacers, dowel bar supports and other devices for spacing, supporting, and fastening reinforcing bars, welded wire fabric, and dowels in place. Use wire bar-type supports complying with CRSI Specifications.

## **2.03 CONCRETE MATERIALS**

A. Portland Cement: ASTM C 150, Type I.

1. Use one brand of cement throughout Project unless otherwise acceptable to Architect.

B. Fly Ash: ASTM C 618, Type F.

C. Normal-Weight Aggregates: ASTM C 33, Class 4, and as follows. Provide aggregates from a single source.

1. Maximum Aggregate Size: 1-1/2 inch.

2. Do not use fine or coarse aggregates that contain substances that cause spalling.

 Local aggregates not complying with ASTM C 33 that have been shown to produce concrete of adequate strength and durability by special tests or actual service may be used when acceptable to Architect.
 D. Water: Portable, having maximum acceptable 0.5 mg/l total chlorine residual.

## 2.04 ADMIXTURES

A. Provide concrete admixtures that contain not more than 0.1 percent chloride ions.

B. Air-Entraining Admixtures: ASTM C 260, certified by manufacturer to be compatible with other required admixtures.

C. Water-Reducing Admixture: ASTM C 494, Type A.

D. High-Range Water-Reducing Admixture: ASTM C 494, Type F or Type G.

E. Water-Reducing and Accelerating Admixture: ASTM C 494, Type E.

F. Water-Reducing and Retarding Admixture: ASTM C 494, Type D.

G. Available Products: Subject to compliance with requirements, products that may be incorporated in the Work include, but are not limited to, the following:

1. Air-Entraining Admixture:

- a. Air-Mix; Euclid Chemical Co.
- b. Darex AEA or Daravair; GCP Applied Technologies.

### PART 3 EXECUTION

### 3.01 SURFACE PREPARATION

A. Proof-roll prepared subbase surface to check for unstable areas and verify need for additional compaction. Do not begin Paving Work until such conditions have been corrected and are ready to receive paving.

B. Remove loose material from compacted subbase surface immediately before placing concrete.

### **3.02 EDGE FORMS AND SCREED CONSTRUCTION**

A. Set, brace, and secure edge forms, bulkheads, and intermediate screed guides for paving to required lines, grades, and elevations. Install forms to allow continuous progress of Work and so that forms can remain in place at least 24 hours after concrete placement.

#### **3.03 PLACING REINFORCEMENT**

A. General: Comply with Concrete Reinforcing Steel Institute's recommended practice for "placing reinforcing bars" for placing and supporting reinforcement.

B. Clean reinforcement of loose rust and mill scale, earth, ice, or other bond-reducing materials.

C. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during concrete placement. Maintain minimum cover to reinforcement in accordance with ACI 318.

#### **3.04 CONCRETE PLACEMENT**

A. Inspection: Before placing concrete, inspect and compete formwork installation, reinforcing steel, and items to be embedded or cast in. Notify other trades to permit installation of their work.

B. Remove snow, ice, or frost from sub-base surface and reinforcing before placing concrete. Do not place concrete on surfaces that are frozen or have standing water.

C. Moisten sub-base to provide a uniform dampened condition at the time concrete is placed. Do not place concrete around manholes or other structures until they are at the required finish elevation and alignment.

D. Comply with requirements and with ACI 304R for measuring, mixing, transporting, and placing concrete.

E. Place and spread concrete in a continuous operation between joints.

#### **3.05 CONCRETE PROTECTION AND CURING**

A. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures.

B. Evaporation Control: In hot, dry, and windy weather, protect concrete from rapid moisture loss before and during finishing operations with an evaporation-control material.

C. Begin curing after finishing concrete but not before free water has disappeared from concrete surface.

D. Curing Methods: Cure concrete by moisture curing, moisture-retaining-cover curing, curing compound, or a combination of these as follows:

1. Moisture Curing: Keep surfaces continuously moist for not less than 14 days with the following materials:

a. Water.

b. Continuous water-fog spray.

c. Absorptive surfaces and edges with a minimum 12 inch lap over adjacent absorptive covers.

## 3.06 FIELD QUALITY CONTROL

A. An independent testing agency will perform field quality control tests, as specified in Section 01 Quality Requirements.

B. Tests of concrete and materials will be performed by compressive strength tests, slump tests, and air content tests according to ASTM Standards.
